Terminology

MATERIAL SPECIFICATIONS

SMMS—Spunbonded Polypropylene, Meltblown, Meltblown, Spunbond Polypropylene (SMMS) fabric consists of four layers of non woven material. The layers are bonded so the material appears single ply; this bonding gives the material extra strength and repellency therefore reducing the risk of bacteria entering the wound site.

SMMS fabric is fluid repellent and has a high hydrostatic head to give exceptional strikethrough protection against water, blood and other bodily fluids. SMMS is low linting, minimising the risk of wound contamination. The strength of the material is obtained from the spunbond polypropylene and the repellency from the meltblown. SMMS fabric allows fluid control and protection whilst still providing patient comfort.

The absorbent panel has a lock away core that is hydrophylically treated which allows high Absorbency

SMS - Spunbonded Polypropylene, Meltblown, Spunbond Polypropylene (SMS) is a non woven fluid repellent fabric. It has similar properties to SMMS, however it has only three layers as opposed to the four of SMMS.

Laminate - This draping material consists of two or three layer laminate, which gives total impermeability over the entire surface. Laminated materials have a PE layer so the drape is impervious. Fluid absorbs into the top layer (spunbond material treated to make the material absorbent) but cannot strike through because of the totally fluid proof PE film. There is a soft base layer that provides comfort for the patient.

Cotton - fabric woven from cotton fibres

PE - Polyethylene (PE) - a plastic layer which is either clear or coloured in our drape portfolio

2 ply – 2 materials bonded together – in the case of the 365 drapes 1 layer is always plastic (PE) to prevent infection

3 ply – 3 layers of material bonded together – in the case of the 365 drapes the middle layer is always plastic (PE) to provide a total barrier and prevent infection.

EFF - Poly Spun Lace – Is a material made from wood pulp polyester. With a texture similar to that of linen, chosen for softness and flexibility of movement. Whilst offering excellent barrier protection, maintaining low heat generation and offering more comfort than other impervious gowns.

Glossary of terms

Absorbent reinforced panel - zoned area around critical operating site to provide extra absorbency and strength

Adhesive edged - a sticky taped edge running down one edge of a drape. The adhesive is used to secure the drape in place during the procedure and is usually fixed to the patient

Aperture - access hole in drape enabling entry to the operating area

Sterile field - a wrap around the product to stop contamination when items are removed from packaging

Tape strip - non woven material backed with adhesive

An absorbent reinforced panel

All measurements of drapes are given in the order of width (cm) and then length (cm).

The fenestration size given in this drape catalogue is the total size of the aperture on the drape. Included in the measurement is the incise (adhesive film around and within the fenestration).

OR DRAPES

365 Healthcare Ltd is an innovative and exciting company, committed to operational excellence. Our focus ensures the provision of unrivalled customer care and excellent on-going product support with solution driven initiatives. We are pleased to present our latest range of surgical drapes available through the NHS Supply Chain.

The drapes range from 365 Healthcare is unique, and designed for single use surgical drapes from offering enhanced absorbency for improved protection.

The range covers a wide variety of surgical procedures offering a complete impermeable draping solution for patient protection.

Comprehensive draping packs are available in addition to a full range of supplementary products.
